

# Overview

## Overview

If your organization has a virtual infrastructure that is managed by VMware vCenter, you can use *up.time* to monitor, diagnose, and report on your virtual machines and management servers. From an administrative perspective, seamlessly integrating virtual and physical assets in *up.time* has several key benefits:

- you can save time by working with one dashboard and management tool for monitoring, alerting, and alert acknowledgement
- you can generate diagnosis graphs from the same monitoring tool, allowing you to view both virtual and physical machines in the same views
- in addition to *up.time*'s dedicated VMware vSphere reports, you can extend *up.time*'s general resource-focused reports to VMware vCenter servers, ESX servers, and VMs
