

Installing an Agent on 64-bit Red Hat Enterprise Linux 6

If you are using the 64-bit variant of Red Hat Enterprise Linux on a 64-bit architecture, ensure you have installed the following library and its dependency before installing the Uptime Infrastructure Monitor agent:

- glibc-2.12-1.7.el6.i686.rpm
- nss-softokn-freebl-3.12.7-1.1.el6.i686.rpm

These files are required to ensure the Uptime Infrastructure Monitor agent functions correctly.

Additionally, consider installing `xinetd`, which is no longer part of the default Red Hat Enterprise Linux installation in v6. Historically, `xinetd` has been the most efficient method for managing the Uptime Infrastructure Monitor agent's life cycle.
