Installation and Quick-Start Guide

In a typical monitoring scenario, deploying up.time includes installing the Monitoring Station, deploying up.time Agents on systems, then running Auto Discovery. Although you can further configure up.time (e.g., create tiers of user groups, schedule automatic report generation, or implement escalation policies into alerts), these initial steps are enough to achieve basic alerting and reporting.

This guide contains information on these first steps:

- Planning Your Installation
- Installing the Monitoring Station
- Installing up.time Agents
  - Installing Agents on IBM pSeries Servers
  - Installing Agents on Linux
  - Installing Agents on Solaris
  - Installing Agents on UNIX
  - Installing Agents on Windows
- Using Auto Discovery
  - Auto Discovery for Servers and Network Devices
  - Auto Discovery for VMware vCenter Inventories
  - Auto Discovery for HMC-Managed pSeries Servers
