Reports

Reports are useful when you need to pinpoint the source of a problem within you environment. Uptime Infrastructure Monitor can generate reports on the status of the servers in your environment, based on criteria that you specify.

With a report, you can visually analyze how individual critical resources - such as memory, CPU, and disk resources - are consumed. You can dynamically generate and view reports, schedule and email reports to other Uptime Infrastructure Monitor users.

This section gives you a breakdown of the different types of reports that are available in Uptime Infrastructure Monitor.

- Using Reports
