Graphs

Graphs allow you to collect and display information for Elements, services, and configurations. Uptime Infrastructure Monitor can display the performance and availability statistics for the systems that you are monitoring in a graph.

You have different graphing options depending on the operating system that is running on a host. The metrics that Uptime Infrastructure Monitor agents capture and return to the Monitoring Station differ from operating system to operating system.

This section gives you a breakdown of the different graphs that are available in Uptime Infrastructure Monitor.

- Graphing Virtual Server Components
- Using Graphs
