

Excluding drives in the File System Capacity monitor

When configuring the File System Capacity monitor, you can have the monitor ignore or exclude certain drives or mount points. Below are some common usage examples:

Ignore a drive or file system by entering the name of the drive or file system in one of the Exclude Pattern fields of the monitor template. For example:

- On Windows, enter `D:` in an Exclude Pattern field.
- On a UNIX platform, enter `/usr` in an Exclude Pattern field.

Ignore a set of similar mount points by setting an exclusion pattern, using the `*` character, to match multiple mount points. For example, on a UNIX platform, enter `/u*` in an Exclude Pattern field to ignore all mounts starting with `u`. Note that you can only use the `*` character at the end of a mount point's name.

Check only a specific drive by setting an exclusion pattern to `*`. This will ignore all drives. Enter special case values for only those drives that you want to check.
