

# Agent running wrong custom script

This symptom commonly occurs when the first field of the upmagent file is not unique.

The first field (the secretpassword) is used as a line identifier to decide which script should be launched.

If you are experiencing this issue, check your .uptmpasswd file to ensure that a \*unique\* password is used for each script. For example:

```
pass1 /opt/uptime-agent/my-scripts/script1.sh  
pass2 /opt/uptime-agent/my-scripts/script2.pl
```
