

# Does the Web Application Transaction monitor download images?

Image handling within the WAT monitor is handled differently depending on the playback script.

For example, if the WAT script was:

```
page0
GET http://www.uptimesoftware.com:80/index.html
GET http://www.uptimesoftware.com:80/images/logo.gif
```

The monitor would issue two requests: one for index.html and another for logo.gif (and download the target image).

However, if the WAT script was:

```
page0
GET http://www.uptimesoftware.com:80/index.html
```

The monitor would only issue one request for index.html page and it would not retrieve the logo.gif that appears on the index page.
