

Administrator's Guide

This guide contains information on administering up.time after it has been installed and Auto Discovery has been performed on your network.

up.time administration comprises organizing discovered Elements and services into groups and Applications, as well as using them to build and define SLAs. Alert thresholds and escalation policies can be managed for these individual or grouped Elements, Applications, and SLAs. User profiles determine which members of the organization have access to specific parts of up.time. This guide also contains information on managing up.time's configuration settings.
