

How to batch add many servers or devices to Uptime Infrastructure Monitor

There are three main options available to add many elements to Uptime Infrastructure Monitor with a single process:

1. Use the Auto-Discovery option under the My Infrastructure tab. This will allow you to scan your network for available servers and devices to be added to Uptime Infrastructure Monitor.
2. Use the Add System command line utility to automatically add systems based on a list from a text file. Refer to [Adding Multiple Systems from the Command Line](#) for more information.
3. Use the API [Working with Elements](#)
4. Contact Uptime Infrastructure Monitor Support for further integration or mass deployment strategies.
